

Management Performance:

Rsc 06 Optimising resource use, reuse and recycling

Credits

No Minimum Standard

Aim

To reduce resource consumption and facilitate the reuse, repurposing and recycling of waste resources from the asset.

Question

Is data recorded on the waste generated during management of the asset?

Credits	Answer	Select a single answer option
0	A.	Question not answered
0	B.	No
2	C.	Yes
4	D.	Yes, plus separate data on the waste generated by the occupant(s)

Is the reduction, reuse and recycling of waste from the asset being optimised through target setting and encouraging occupant participation?

Credits	Answer	If answer option C or D has been selected, select all answers that apply
1	E.	Targets have been set for reducing waste generated from the asset and increasing reuse and recycling of waste from the asset
1	F.	The organisation managing the asset actively encourages reuse and recycling participation by occupant(s)

Assessment criteria

Criterion	Assessment criteria	Applicable Answer
1.	The data shall be recorded in the BREEAM In-Use Rsc 06 Waste data reporting tool according to the Methodology and Table 35 in Checklists and tables. The tool can be accessed through the BREEAM In-Use Assessor extranet or the BREEAM In-Use online platform.	C, D

Criterion	Assessment criteria	Applicable Answer
2.	Waste generated during management of the asset may be recorded in combination with occupant waste if separate data is not available.	C
3.	Waste generated by the occupant(s) shall be recorded separately from waste generated during management of the asset. Where the organisation managing the asset is also the sole occupant of the asset, waste from asset management and from occupant spaces shall still be recorded separately.	D
4.	The data shall be presented annually to the senior management of the organisation managing the asset.	C, D
5.	The senior management of the organisation managing the asset shall review and endorse annual targets for reducing waste generated from the asset and increasing reuse and recycling of waste from the asset.	E
6.	The organisation managing the asset communicates the following to the occupant(s): a) The waste hierarchy and other relevant background information on waste b) How and why recording waste from the asset is being done c) The quantities and types of waste produced by the asset d) The sustainability benefits of reducing, reusing and recycling waste from the asset e) Relevant examples/case studies from other assets f) The facilities provided for reuse and recycling g) How occupants can obtain more information and guidance. This information shall be communicated in-person or as a recorded presentation to the relevant senior staff: a) Of every new occupant organisation upon occupying a space b) And then at least annually to every occupant organisation.	F

Methodology

Waste collection requirements

The total mass or volume of waste generated from the asset shall be recorded annually by waste stream. The following data shall be recorded for each separate waste stream:

- Waste description
- Waste classification (including identification of hazardous waste)
- Quantity of waste generated
- Source of waste
- Disposal route

Either mass (tonnes) or volume (m³) may be used, but the chosen unit shall be used consistently for all data gathered for the asset. Please note that if the data is to be reported to other organisations (e.g. industry benchmarking organisations) care should be taken to ensure the unit used is compatible.

Checklists and Tables

Table 35: Waste recording requirements

Input	Input type	Input options	Description
Waste description (optional)	Text	N/A	Description of waste generated by asset.
Waste code	List selection	- European Waste Catalogue - Other classification system	Waste classification code for each waste stream generated by the asset.
Hazardous waste classification	List selection	Yes/No	Identification of hazardous waste.
Quantity	Number	N/A	The quantity of waste generated by the asset. Reported as either mass (tonnes) or volume (m ³).
Source	List selection	- Asset management - Occupant(s) - Unknown (or combined asset management and occupant)	The source of waste.
Source activity	List selection	- Construction activities - Non-construction activities	The source activity.
Disposal route	List selection	- Diverted – reuse – at the asset (or stored for reuse at the asset) - Diverted – reuse – not at the asset - Diverted – recycling – at the asset - Diverted – recycling – closed-loop - Diverted – recycling – not closed-loop/unknown - Diverted – waste to energy	The destination of the waste generated by the asset.

		- Incineration - Landfill	
--	--	------------------------------	--

Evidence

Criteria	Evidence requirement
-	The evidence below is not exhaustive, please also refer to the 'BREEAM evidential requirements' section in the scope of the Guidance for appropriate evidence types which can be used to demonstrate compliance.
1 - 3	Data on waste generated during management of the asset should be correctly collected in the BREEAM In-Use Rsc 06 Waste data reporting tool and submitted into the BREEAM In-Use online platform. This includes evidence of the organisation/individual that collected the data provided and the source of the data.
3	Data on waste generated by the occupant(s) recorded separately from waste generated during management of the asset.
4	A copy of the document/presentation given. An acknowledgement from the senior management that the document was received OR meeting minutes showing the senior management were presented with the data. Documentation showing the names and positions of senior management.
5	A copy of the document containing the targets. An acknowledgement OR meeting minutes showing the senior management have reviewed and endorsed the targets. Documentation showing the names and positions of senior management.
6	A copy of the presentation, with the relevant sections identified according to each question answer and criterion. A list of dates and attendee lists, from the organisation managing the asset, when the presentation was given to each occupant.

Definitions

Closed-loop recycling:

Where waste is recycled back into the same product that the waste came from as opposed to open-loop recycling where it is recycled into a different product often of lower value (sometimes called downcycling). Closed-loop recycling may be achieved by, for example, a product manufacturer take-back scheme.

Hazardous waste:

Waste classified as hazardous by the nationally applicable waste classification system (e.g. in the EU, the Hazardous Waste List (HWL) of the European List of Waste (LoW)).

Waste classification:

According to the nationally applicable waste classification system (e.g. in the EU, the European List of Waste (LoW) codes shall be used).
